2x HPP 9MW + 8MW Centrale hydroélectrique historique

TARGET PRICE
\$ 70,000,000

Les centrales hydroélectriques jouent un rôle important dans la production d'énergie au Canada, le pays étant l'un des plus grands producteurs d'électricité au monde. Le vaste réseau de rivières et le relief montagneux du Canada en font un lieu idéal pour le développement de centrales hydroélectriques.

Le Canada compte plus de 500 centrales hydroélectriques qui, ensemble, produisent environ 60 % de l'électricité du pays. La plus grande centrale hydroélectrique du Canada est la centrale de Churchill Falls, à Terre-Neuve-et-Labrador, qui a une capacité de plus de 5 400 mégawatts. Parmi les autres centrales hydroélectriques importantes au Canada, citons la centrale Robert-Bourassa au Québec et la centrale Sir Adam Beck en Ontario.

Les centrales hydroélectriques fonctionnent en exploitant le débit d'eau des rivières et des lacs pour produire de l'électricité. L'eau est stockée dans des réservoirs créés par les barrages et, lorsqu'elle est libérée, elle passe dans des turbines qui font tourner des générateurs pour produire de l'électricité. Cette source d'énergie renouvelable est propre et fiable, ce qui en fait un choix populaire pour répondre aux besoins énergétiques du Canada.

Malgré ces difficultés, les centrales hydroélectriques continuent de jouer un rôle crucial dans le bouquet énergétique du Canada. Compte tenu de l'engagement du pays à réduire les émissions de gaz à effet de serre et à passer à des sources d'énergie renouvelables, l'hydroélectricité restera probablement un élément clé de l'avenir énergétique du Canada.
